Dependency Report (Spring boot Upgrade)

Please download the Html to check the dependency usage.

Problem Statement CVE-2024-34750:

Improper Handling of Exceptional Conditions, Uncontrolled Resource Consumption vulnerability in Apache Tomcat. When processing an HTTP/2 stream, Tomcat did not handle some cases of excessive HTTP headers correctly. This led to a miscounting of active HTTP/2 streams which in turn led to the use of an incorrect infinite timeout which allowed connections to remain open which should have been closed.

This issue affects Apache Tomcat: from 11.0.0-M1 through 11.0.0-M20, from 10.1.0-M1 through 10.1.24, from 9.0.0-M1 through 9.0.89.

Users are recommended to upgrade to version 11.0.0-M21, 10.1.25 or 9.0.90, which fixes the issue.

This problem happens because of above Tomcat version and HTTP/2 request .

Resolution

org.apache.httpcomponents	httpclient	4.5.13	compile	jar	false
org.apache.httpcomponents	client5 httpclient5	5.2	compile	jar	false

CVE-2020-15250 exist CVE-2024-34750 is not.

This component does not uses the mentioned venerability -PASSED
